** This figure relates to the number of donors for whom the retrieval operation commenced for the purpose of transplantation. This includes donors who may have been deemed medically unsuitable at the time of surgery or after removal of organs.

Donor figures for 2004 include three donors who went to the operating theatre but organs were not retrieved.

One New South Wales donor had positive serology and the liver was found to be diseased, one South Australian donor had an intra-abdominal infection and one Western Australian donor's organs were medically unsuitable on biopsy.

In 2004 there was a range between the States of four donors per million population (dpmp) in Tasmania to 25 dpmp in South Australia.

Historically the comparison of organ donation rates between states and countries has been based upon donors per million population (dpmp).

However, using the number of deaths and therefore the ability of a deceased person to be a donor as the denominator may be a more reasonable way of comparing donation rates (fig.9.2).

Australian and New Zealand data on deaths for 2004 were not available at the time of going to print.

DONOR PROFILE

Age and Gender Distribution

In Australia in 2004, 10% (22 donors) were 65 years or older and 3% (six donors) were aged 75 years or older. The oldest donor was 80.5 years.

The mean age for donors in Australia increased to 43.2 years in 2004 from 42.7 years in 2003. The mean age for Australian mainland States ranged from 34.6 years in Tasmania to 47.8 years in New South Wales. The Northern Territory had one donor aged 59.5 years.

The median age for Australia increased from 45.5 years in 2003 to 46.6 years in 2004. The age range was between 13.5 months and 80.5 years.

In New Zealand in 2004 the mean age increased to 43 years from 38 years in 2003 and the median age to 46.1 years from 39.7 years previously.

Four donors (10%) were aged 65 years or older. The age range was 13.8 months to 78.2 years.

The gender distribution by Australian States and New Zealand is shown in Figure 9.4.

CAUSE OF DONOR DEATH

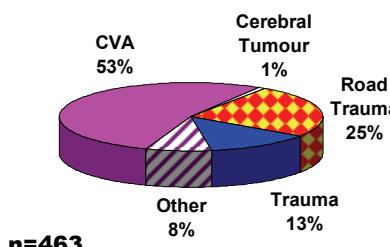

Figure 9.5 shows the cause of death for all organ donors in Australia since 1989 and for New Zealand since 1993.

The primary cause of death was cerebrovascular accident (CVA), (48% of all Australian donors and 53% of all New Zealand donors).

Figure 9.6 shows detailed cause of death by gender for 2004.

Figure 9.7 shows that CVA is the main cause of death in donors 55 years and older, 85% in Australia and 87% in New Zealand, whereas in the 15-34 year age group, trauma accounted for 51% of all deaths in Australia and 62% in New Zealand in 2004.

SUMMARY - ORGANS REQUESTED, CONSENT GIVEN, RETRIEVED AND TRANSPLANTED

The information relating to the request for organ donation refers only to those patients who become organ donors. If consent was sought and refused, the Registry has no record of these potential donors.

The difference between a request and a consent is a known objection by the donor or family refusal for the specific organ.

Reasons for not requesting organs, not retrieving and not transplanting are documented for all of the specific organs.

NB: 2 kidneys = 1 organ, 2 lungs = 1 organ

On occasions when only one kidney is retrieved, this is also defined as one organ.

ORGAN RECIPIENTS TRANSPLANTED

Australia had 3.6 and New Zealand 2.8 organ recipients per donor used for transplantation in 2004. The number of recipients transplanted is used for this calculation, rather than the number of organs. The Australian Capital Territory (ACT) had the highest

number of organs transplanted, 4.0 per donor, followed by New South Wales 3.8, Queensland and Victoria 3.6, Tasmania 3.5, South Australia 3.3, the Northern Territory 3.0 and Western Australia 3.1. These figures exclude tissue transplantation.
