#### Acknowledgments

ANZDATA Registry offers its most grateful appreciation to everyone who helped make this 28th Annual Report possible, especially the professionals and the staff of all the Renal Units and Tissue Typing Laboratories, upon whose reporting of data this enterprise ultimately depends.

#### Suggested Citation

An example of suggested citation for this report is as follows:

.. [Author's name] .. Peritoneal Dialysis .. [page numbers] .. ANZDATA Registry Report 2005 Australia and New Zealand Dialysis and Transplant Registry Adelaide, South Australia.

Editors: Stephen McDonald and Leonie Excell

Publications based upon ANZDATA Registry information reported here or supplied upon request, must include the citation as noted above and the following notice:

> The data reported here have been supplied by the Australia and New Zealand Dialysis and Transplant Registry. The interpreta tion and reporting of these data are the responsibility of the Editors and in no way should be seen as an official policy or interpretation of the Australia and New Zealand Dialysis and Transplant Registry.

Immunosuppressive Therapy at Specific Intervals - New Zealand Grafts 1995-2004

41

The ANZDATA Registry is pleased to present its 28<sup>th</sup> Annual Report which covers the calendar year 2004. Once again we are confident that there is 100% reporting of patients who have received dialysis and transplantation services in Australia and New Zealand. This confidence is because of the ongoing commitment to the Registry of renal units in those countries and the hard work that the staff of those units put into the timely and accurate provision of data.

The staff of the Registry have also continued to provide dedicated and excellent service. Lee Excell continues in her role as Manager of the Registry, Brian Livingston provides Information Technology expertise and data analysis and Lis Steinmetz provided administrative support.

There have been some changes to the staffing structure of the Registry in 2004. Bianca Byrne resigned her position as Biostatistician. Victoria Shtangey has been appointed in that role since November 2004. The role of the biostatistician is to provide statistical and database analysis and to allow the Registry to respond rapidly to requests for data from Contributors and others.

In addition Dr Stephen McDonald has been appointed as the Executive Officer of the Registry. As such he will have oversight of all the Registry activities as well as continuing to provide scientific and epidemiological input at all levels. The Registry is indeed fortunate to have Dr McDonald appointed in this role as his input in his previous appointment as Fellow in Epidemiology has been highly valued.

2004 saw the introduction of several innovations in the Registry. We now have a full year of collection for the Peritonitis Registry and a short report on this is contained in this volume. In addition there is now a full year collection of the Living Kidney Donor Registry and these data will be analysed at a later date. The Internet based data exchange scheme became operational in January 2005. This has enabled data entry from contributing units including the real time data entry of key events.

A change to the data collection timing for the Registry also has taken place in 2005. There is now only one annual data collection rather than the two as previously. The collection of key events such as new patient entry, transplantation, graft failure and death is another innovation which hopefully will allow up to date real time reporting of activity.

The major funding for the Registry continues to come from the Australian Commonwealth Department of Health and Ageing. Funds also are provided from Kidney Health Australia and the New Zealand Ministry of Health.

Non-tied Grants have also been received from AMGEN Australia Pty Ltd, Novartis Pharmaceuticals Australia Pty Ltd, Janssen-Cilag Pty Ltd, Fresenius Medical Care Australia, Roche Products, Pty Ltd, and Wyeth Australia Pty Ltd.

The production of this Report and the on going data collection, analysis and reporting activities of the Registry rely on the hard work of a number of individuals and Committees. The ANZDATA Registry Executive and the ANZDATA Registry Steering Committee membership are listed on page 7. In addition there are a number of smaller Working Groups which work in each of the specialty areas. These Groups have responsibility for defining the type of data to be collected from the contributing units as well as providing guidance for the analysis of that data.

#### PRIVACY

In December 2001 changes to the Commonwealth Privacy Act were introduced which have led to changes to the collection of personal information. Essentially these extend to the private sector a number of changes based around 10 "National Privacy Principles" (NPP's). A detailed exposition of these can be found at the Privacy Commissioner's website (www.privacy.gov.au). Briefly, however, health information is treated as "sensitive" information, which must usually be collected and handled with consent of the person, unless certain conditions are met. Patients are entitled to view the information the Registry holds about them, and request alterations if the data is thought to be inaccurate.

Each Australian State has also enacted similar provisions which cover practice and patients in public hospitals.

ANZDATA does not release data identifiable by patient name. Results are published/ released in tabular or graphic format. On occasion, when data identifying particular hospitals is involved, consent from the Director of the relevent renal unit is sought prior to the release of information.

#### **COLLECTION OF DATA**

ANZDATA spent some time during 2002 formulating an appropriate response to these issues including seeking advice from a variety of sources. The approach taken has been that of a "opt-out" consent, whereby patients are distributed information outlining the nature and purpose of the information collected, offered an opportunity to view that data and ask questions, and the opportunity to request withdrawal of part or all of their data. This approach is explicitly suggested for Registries by the Privacy Commissioner in his "Guidelines for the Health Sector". To this end ANZDATA has circulated to all participating hospitals a patient information sheet (see opposite), for each hospital to use (or a locally modified version if appropriate) to inform patients.

At the time of data collection each unit is asked to certify that they have complied with measures under the relevant privacy measures.

#### ANZDATA REGISTRY

#### AUSTRALIA AND NEW ZEALAND DIALYSIS AND TRANSPLANT REGISTRY

C/- The Queen Elizabeth Hospital 28 Woodville Road Woodville South, 5011 South Australia Phone: (08) 8222.6704 Fax: (08) 8222.6402 Email: anzdata@anzdata.org.au Web: http://www.anzdata.org.au

#### **Important Privacy Information**

As part of routine medical care of people receiving treatment with dialysis or kidney transplantation, your kidney specialist collects certain information about the patients they treat. All kidney specialists throughout Australia and New Zealand report this information every twelve months to the Australia and New Zealand Dialysis and Transplant Registry (ANZDATA). ANZDATA collects the information for the purpose of monitoring treatments and performing analyses to improve quality of care for people with kidney failure.

#### 1. What is ANZDATA ?

ANZDATA is an organization set up by Kidney Health Australia and the Australia and New Zealand Society of Nephrology to monitor dialysis and transplant treatments. ANZDATA is funded by the Australian and New Zealand Governments and Kidney Health Australia.

#### 2. What information is collected about you ?

This information includes your name, age, gender, racial origin, hospital of treatment, some aspects of your medical condition (such as whether you have diabetes) and details about the type of kidney treatment you are receiving (dialysis or transplant).

We **<u>DO NOT</u>** collect details about your address, telephone number, medical insurance, or non-medical matters such as occupation, income, etc.

#### 3. Is personal data ever released ?

The identity of people in the database **<u>IS NOT released publicly nor in any reports</u>**. Measures have been put into place to ensure the security of all collected information.

#### 4. What is this information used for ?

The information is used primarily for quality assurance, investigating patterns of kidney disease, and planning appropriate health services. We release reports on a variety of topics, including an Annual Report examining the rates and treatment of kidney failure in Australia and New Zealand. We also have a major role in ensuring the quality of patient care by sending to each kidney unit each year a report outlining their activity. These reports also compare the outcome of the treatment they provide with that of other units throughout the two countries. Reports are also produced at a state and national level, and from time to time analyses are also produced for renal units, government health departments and industry concentrating on particular aspects of renal failure management e.g. peritoneal dialysis, transplantation, haemodialysis.

5. Can you see what personal information ANZDATA collects and the reports that it produces ? Individuals are able to view their own information on request. You can request alterations if you believe it is inaccurate. You may also opt not to have your treatment included in this database, and you should let your kidney specialist know if this is the case. You can also choose not to have some information (e.g. racial origin) recorded. However, if your information is not included in the Registry, the ability to compare results in Australia and New Zealand or to analyse the results of different treatment methods and for different patient types (e.g. diabetics) will be compromised.

The national reports and much other material produced by ANZDATA are available free on the Internet at <u>www.anzdata.org.au</u>, or they can be sent to you on request to the address above. Your kidney specialist will also have copies of many of the reports.

If you wish to discuss any of the issues raised here, please let your doctor know or telephone the ANZDATA Registry direct on [08] 8222 6704. You may also write to us (ANZDATA Registry, C/- The Queen Elizabeth Hospital, 28 Woodville Road SA 5011) or send us an e-mail (anzdata@anzdata.org.au).

## ANZTA

#### **GUIDELINES FOR DATA RELEASE**

The policy for release of data to investigators, renal units and others was revised during 2002 and is summarised on the Website. ANZDATA encourages the analysis, use and citation of its data, and receives many data requests annually which vary in size and complexity. At times these overwhelm the limited resources within the Registry, and must be prioritised. Generally, formal requests for data are preceded by a period of consultation with a member of the Registry staff. Requests are welcome from Renal Physicians, other staff members of Renal Units, Charitable Bodies, Academic Institutions, Government Departments and Industry. Requests dealing with identifiable Hospital data will only be fulfilled with the explicit consent of the Heads of the relevant Hospital Units.

#### **ATTRIBUTION OF PUBLICATIONS**

The policy on attribution of publications which incorporate ANZDATA sourced data was revised during 2002, following a period of consultation with participating physicians.

Where a member of a participating unit has analysed data provided by ANZDATA and subsequently prepared a manuscript, then "ANZDATA Registry" should be acknowledged as a secondary institution in addition to the author's Hospital or University. This applies whether the primary data analysis is performed by the author or by ANZDATA staff. Where the author is an ANZDATA office holder or staff member then the primary attribution should be "ANZDATA Registry".

Where ANZDATA data is only a minor portion of the work, then it may be more appropriate to acknowledge the source explicitly in the "Acknowledgements" section.

In both cases the disclaimer on page ii of this report should be included.

In all cases the source and treatment of the data should be made clear in the "Methods" section. Preferably the abstract (and keywords if applicable) should also include "ANZDATA" which would allow for searching Registry publications.

Research Fellow, Centre for Kidney Research, The Children's Hospital at Westmead, Room 13, Clinical Sciences Level 2, Locked Bag 4001, Westmead, New South Wales, 2145

These definitions apply throughout this report unless otherwise stated.

#### 1. Wording

Throughout this report 'treatment' refers to renal replacement therapy, including haemodialysis, peritoneal dialysis and transplantation

HD = haemodialysis	CAPD = continuous ambulatory peritoneal dialysis
APD = automated peritoneal dialysis	ESKD = end stage kidney disease

#### 2. Data collection

ANZDATA collects information from all renal units in Australia and New Zealand every 12 months. Currently this is by a paper-based system, with manual completion of the form and manual data entry. No formal audit mechanism is in place at this stage.

For transplants, HLA matching and panel reactive antibodies are obtained direct from the Tissue Typing laboratories in each State.

#### 3. Inclusion criteria

Included in the Registry are all patients receiving renal replacement therapy where the intention to treat is long-term, i.e. medical opinion is that renal function will not recover. Cases of acute renal failure are excluded. People who move overseas permanently are censored at date of last treatment (or departure in the case of transplant recipients).

#### 4. Modality attribution

The initial mode of dialysis is determined at 90 days after first treatment, to allow for early changes and maturation of access. Other transfers (between modalities, or from satellite to hospital haemodialysis etc.) are not analysed if less than 30 days, except for transfers between dialysis centres to which a 60 day rule is applied to allow for holiday movements.

#### 5. Underlying renal disease

This is recorded by the treating hospital according to a modified EDTA coding system (details on back of survey form).

#### 6. Deaths

Death rate is predominantly reported as number of patients died/total number of years of treatment of all patients treated at any time during the year. It is expressed as deaths per 100 patient years (pt yrs) at risk.

#### 7. Comorbid conditions

These are recorded by the treating hospital. No definitions are supplied; the treating clinician is asked to record whether the patient has coronary artery disease, chronic lung disease, cerebrovascular disease, peripheral vascular disease or diabetes according to their clinical opinion on a yes / suspected / no basis.

#### 8. Transplant Waiting List

The active transplant waiting list includes listing at any stage during the survey period.

#### 9. Derived measures

#### 9.1 Haemoglobin

Haemoglobin is recorded as the last available measurement before the end of the survey period.

#### 9.2 Erythropoietic agents

Erythropoietin agent use is recorded as "yes" if these agents were used at any time during the survey period.

#### 9.3 Iron Studies

Iron studies are requested within the last three months of the survey period.

#### 9.4 Estimated creatinine clearance

Where creatinine clearance is estimated from serum creatinine at entry or post transplantation, the Cockroft-Gault equation is used [1].

Clcr=(140-age)\*weight / (814\*Crserum)[\*0.85 if female]

The weight term used for this is lean body mass, calculated using the equation LBW=(0.9\*[height-152])+(50 if male, 45.5 if female) [2].

#### 9.5 Urea reduction ratio / Kt/V

Results are requested in one of these formats, using the stop flow method on a mid-week dialysis. Single pool Kt/V is collected, along with the method used.

For conversion of URR to Kt/V urea the formula used [3] is

Kt/V = 0.023\*PRU - 0.284 (note that PRU = percent reduction in urea and not URR).

#### 9.6 Body Mass Index

Body mass index (BMI) is calculated as

 $\frac{\text{weight (kg)}}{(\text{height (m)})^2}$ 

The standard NH&MRC categories are used:	underweight	$<20 \text{ kg/m}^2$	normal	$20-24.9 \text{ kg/m}^2$
	overweight	25-29.9 kg/m <sup>2</sup>	obese	$>=30 \text{ kg/m}^2$

#### 9.7 Peritoneal Dialysis measures

These are the standard measures, often calculated by computerised patient management programs.

#### 9.7.1 Residual renal function

The measure used is the arithmetic mean of urea and creatinine clearance from a 24-hour urine collection and serum creatinine and urea.

#### 9.7.2 Peritoneal equilibration test

The ratio of dialysate to plasma glucose is used, following a 4 hour dwell of a 2 litre 2.5% bag of dialysate, performed within 6 months after initiation of peritoneal dialysis.

#### 10. Rates & Measures

#### 10.1 Incidence rates

Except where otherwise stated, quoted incidence rates are per calendar year, and are expressed per million population.

#### 10.2 Prevalence rates

Except where otherwise specified, prevalence rates are point prevalence rates at 31<sup>st</sup> December 2004.

#### 10.3 Population denominator

The population estimates used are the estimated resident populations (ERP) for the year 2004, released by the Australian Bureau of Statistics and Statistics New Zealand. Figures used are those for the June quarter.

For both countries, the statistics bureaux record indigenous status on a self-identification basis. For Australia, there has been considerable change in the propensity to self-identify as indigenous, such that a number of estimates are released by the ABS [4]. For this report, the low range projections have been used.

#### 10.4 Survival rates

For transplant recipients, survival rates exclude those who were transplanted overseas or were recipients of multiple organ grafts.

Graft survival (unless otherwise qualified) includes both cessation of graft function (i.e. return to dialysis) and patient death.

Patient survival for transplant recipients - rates for fixed periods are calculated according to the life-table method and include an adjustment to the risk-set of ½ of those censored without failure over the interval to create an "average" risk set.

#### 10.5 Graft Survival

For outcomes of kidney transplants, graft failure includes both loss of graft function (i.e. return to dialysis) and death of patients (with graft function). Calculations of patient survival for transplant recipients includes all subsequent modalities (i.e. deaths after graft failure are included). Patients transplanted overseas are excluded from calculations.

#### 10.6 Dialysis Survival

Patient and technique survivals for haemodialysis and peritoneal dialysis are based on the dialysis modality at 90 days after first treatment for patients not grafted during that period. Patients are followed up until they are either grafted (at which point they are censored) or until they have a 'permanent' change of dialysis modality or until death or most recent follow up date. A 'permanent' change of dialysis is defined as any change in excess of 30 days.

Peritonitis survivals are calculated from first peritoneal dialysis (ignoring all earlier treatments) to date of first peritonitis episode. If there were no episodes of peritonitis then calculation is censored at change of treatment from peritoneal dialysis to haemodialysis or transplantation. Peritoneal dialysis includes automated peritoneal and continous ambulatory peritoneal dialysis. Excluded are patients who had peritonitis before commencing peritoneal dialysis.

#### 10.7 Death and other event rates

Rates are expressed per 100 person years at risk (unless otherwise stated). Some analyses include survival of all patients, others exclude the first 90 days of followup. This is stated in the individual analyses.

#### 10.8 Age standardisation

All rates are crude, not age-standardised. The age distribution of the populations for Australia and New Zealand are given in Appendix I.

#### 11. Database

Data is stored on a relational database using ORACLE version 8I.

#### 12. Statistics

Statistical analyses were performed using SPSS release version 10.0.7 and Stata version 9.

## SUMMARY

#### **KEY SUMMARY POINTS**

#### AUSTRALIA

- There were 14,221 patients (707 per million) receiving renal replacement therapy (RRT) at 31<sup>st</sup> December 2004. Of these, 6,269 (312 per million) had a functioning kidney transplant and 7,952 (395 per million) received dialysis treatment.
- 1,912 patients commenced RRT in Australia in 2004 (95 per million). The intake varied from 395 per million population in the Northern Territory to 64 per million in Tasmania.
- The mean age at commencement was 59.5 years.
- 25% of new patients had glomerulonephritis attributed as their cause of end stage renal failure, 30% diabetic nephropathy, and 13% hypertension.
- Of patients <65 years of age and receiving dialysis treatment, 33% were on the active kidney transplantation waiting list. This proportion varied between 7% in the Northern Territory and 48% in the Australian Capital Territory. Only 6% of Aboriginal/Torres Strait Islander patients <65 years were on the transplant waiting list.
- The death rate per 100 patient years was 15.4 for dialysis dependent patients (haemodialysis 15.2, peritoneal dialysis 16.0) and 2.0 for those with a functioning kidney transplant (cadaver donor 2.4, live donor 1.1).
- Of the 1,205 deaths among dialysis dependent patients in 2004, 40% were due to cardiovascular causes, 14% to infection, 27% to withdrawal from treatment and 5% from malignancy.
- Of the 125 deaths among patients with kidney transplants, 22% were due to cardiovascular causes, 39% due to malignancy and 21% to infection.
- There has been a 3% increase in the total number of prevalent dialysis patients.
- The numbers of peritoneal dialysis dependent patients decreased by 9% from 1,840 to 1,778 in 2004.
- There were 649 kidney transplant operations performed in 2004, a transplant rate of 32 per million population.
- Of these, 37% (243 grafts) were from live donors, compared to 40% (243 grafts) in 2003. 22% of live donor operations were performed without the recipient receiving prior dialysis therapy.
- For primary deceased donor grafts performed in 2003-04, the 12 month patient and graft survival rates were 96% and 90% respectively.
- The five year primary deceased donor recipient and graft survival for operations performed in 1997-98 were 86% and 77% respectively.
- There were 6,269 functioning kidney transplants in Australia at 31<sup>st</sup> December 2004, a prevalence of 312 patients per million (a 5% increase over 2003).

#### **KEY SUMMARY POINTS**

#### **NEW ZEALAND**

- There were 2,994 patients (737 per million) receiving renal replacement therapy (RRT) at 31<sup>st</sup> December 2004. Of these, 1,224 (301 per million) had a functioning kidney transplant, and 1,770 (436 per million) received dialysis treatment.
- 447 patients (110 per million) commenced RRT in 2004.
- The mean age at commencement was 57.5 years.
- Diabetic nephropathy accounted for 40% of new patients and glomerulonephritis 24%.
- Of patients <65 years of age, 24% were on the active kidney transplantation waiting list. 22% of Maoris and 16% of Pacific People <65 years of age were on the transplant waiting list.
- The death rate per 100 patient years was 17.3 for dialysis dependent patients (haemodialysis 15.2, peritoneal dialysis 20.0) and 2.1 for those with a functioning kidney transplant (cadaver donor 2.3, live donor 1.6).
- Of the 301 deaths among dialysis dependent patients in 2004, 51% were due to cardiovascular causes, 12% to infection, 22% to withdrawal from treatment and 5% from malignancy.
- Of the 25 deaths among patients with a kidney transplant, 12% were due to cardiovascular causes, 32% due to malignancy and 24% due to infection.
- The number of patients who were dialysis dependent at 31<sup>st</sup> December 2004 (1,770) was an increase of 3% over the previous year. 56% of all dialysis dependent patients were receiving home dialysis. 75% of these were on peritoneal dialysis.
- The reported haemoglobin and use of erythropoietic agents have continued to increase over recent surveys.
- There were 105 kidney transplant operations performed in 2004, a rate of 26 per million population.
- The percentage of live donors in 2004 was 46%.
- For primary deceased donor grafts performed in 2003-04, the 12 month patient and graft survival rates were 95% and 89% respectively.
- The five year primary deceased donor recipient and graft survival for operations performed in 1997-98 were 84% and 73% respectively.
- The 1,224 functioning kidney transplants at 31<sup>st</sup> December 2004, a prevalence of 301 per million represents a 5% increase from 2003.
