

# CHAPTER 1

## STOCK AND FLOW

Leonie Excell  
Stephen McDonald

The number of new patients in Australia increased by 5% in 2008 after a 3% decrease in 2007 and a 4% increase in 2006. While there is considerable variation in this rate of increase from year to year, over the longer term the rate of increase is steady.

In New Zealand there was a 6% increase in 2008 after a 7% decrease in 2007. The number of new patients in 2008, (492) was the second highest ever recorded, slightly lower than in 2006 (499 patients).

Rates of prevalent patients and new patients are shown in Figures 1.1 - 1.3.

The overall number of new transplants increased by 32% in Australia in 2008 after a 4% decrease the previous year, and live donors continue to increase overall. In 2008, 354 live donor transplants were reported, an increase of 31% from 2007 and the highest number ever.

Further data about stock and flow is shown in Figures 1.6 - 1.14.

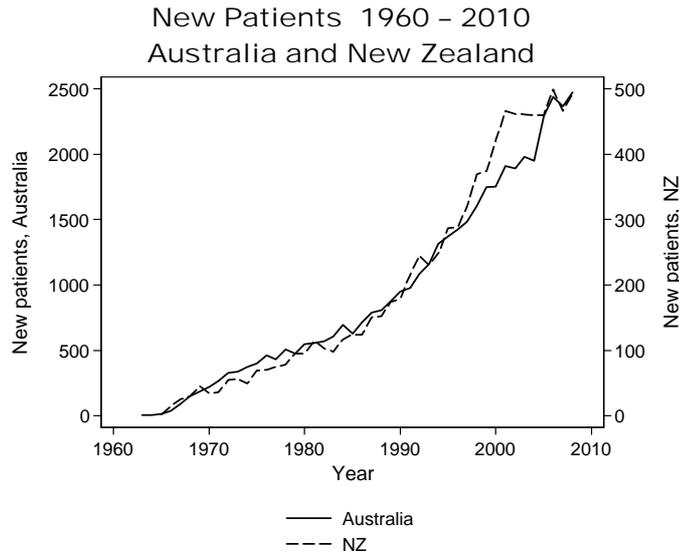

The number of new transplants remained similar in 2008 in New Zealand (122 transplants), with a 19% increase in live donors (69 donors) the highest ever.

Figure 1.3

Numbers of new (incident) RRT patients in Australia have been progressively increasing with a recent drop in 2007. Whether there has been a substantial change in the overall pattern will not be apparent for several years.

Rates in New Zealand have clearly stabilised for the past five years.

Figure 1.4

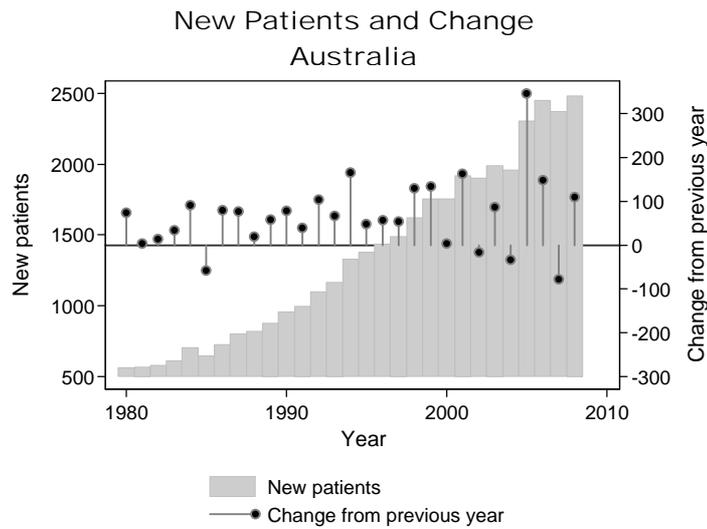

Figure 1.5

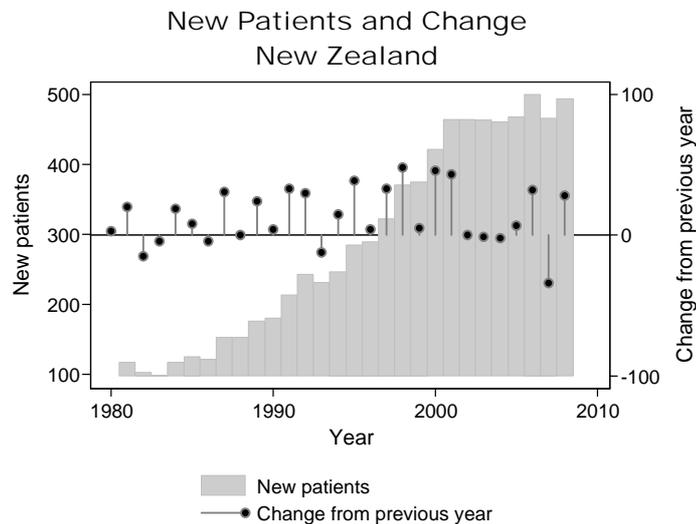

Figure 1.6

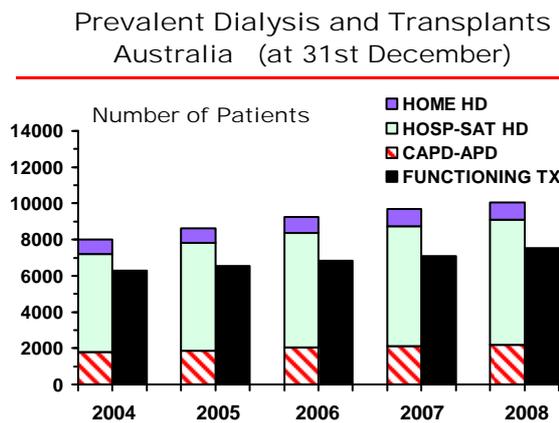

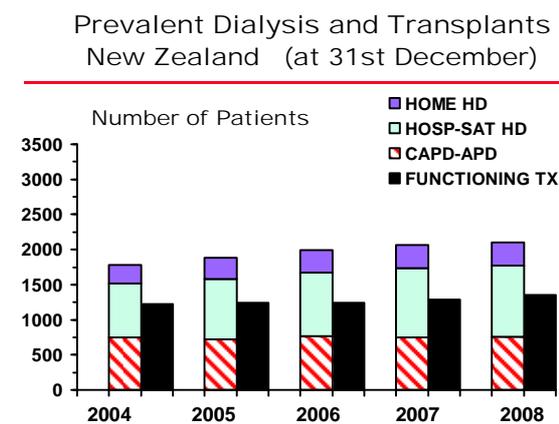

Figure 1.7

The incident rate among Australian Aboriginal, Maori and Pacific People is substantially higher than among non-indigenous people. This, together with lower rates of transplantation, leads to higher rates of prevalent dialysis patients (Figure 1.8).

There is substantial variation in incidence rates and especially transplant rates leading to differences in the balance between dialysis and transplantation in various States (Figure 1.11 - 1.14).
