# **CHAPTER 11**

# **PAEDIATRIC REPORT**

Steven McTaggart
Sean Kennedy
Stephen McDonald
Paul Henning
Hannah Dent

This year, as well as providing a summary of current trends in the frequency and causes of ESKD, the paediatric report will focus on dialysis delivery and adequacy, technique survival and biochemical outcomes, as well as an overview of frequency, causes and treatment for children and adolescents with ESKD.

# INCIDENCE AND PREVALENCE OF ESKD IN CHILDREN AND ADOLESCENTS 1980 - 2008

#### **GENERAL OVERVIEW**

As shown in Figure 11.1, there is no clear long term trend in the incidence of children and adolescents developing ESKD and being treated with renal replacement therapy, although there are fluctuations from year to year.

Prevalent numbers of treated ESKD have gradually increased across all age groups reflecting improved survival through increased duration of ESKD (Figure 11.2).

Figure 11.1

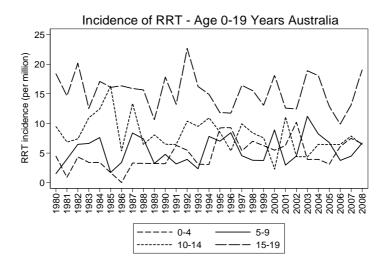

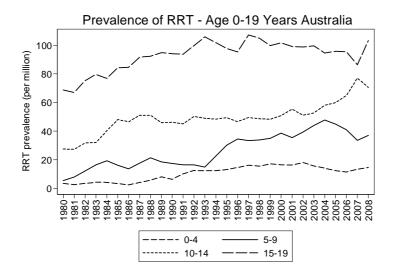

Figure 11.2

#### CAUSES OF ESKD IN CHILDREN AND ADOLESCENTS 2003 - 2008

Overall, glomerulonephritis remains the most common cause of ESKD in children and adolescents (29%) but causes vary significantly with age. In young children renal hypoplasia / dysplasia is the most common cause while reflux nephropathy is a common cause of ESKD in adolescents.

Figure 11.3										
Causes of End Stage Kidney Disease In Children and Adolescents 2003 - 2008										
Primary Renal Disease		Tatal								
	0-4	5-9	10-14	15-19	Total

Interstitial Nephritis	-	1 (1.5%)	-	3 (1.6%)	4 (1.1%)					
Cystinosis	-	3 (4.6%)	1 (1.4%)	-	4 (1.1%)					
Uncertain	1 (1.8%)	1 (1.5%)	3 (4.2%)	11 (6.1%)	16 (4.3%)					
Miscellaneous / Other	16 (29.6)	13 (20%)	12 (16.9%)	20 (11.1%)	61 (16.5%)					
Total	54 (100%)	65 (100%)	71 (100%)	179 (100%)	369 (100%)					

### MODALITY OF TREATMENT 2003 - 2008

The modality of the first renal replacement treatment is shown in Figure 11.4. Although numbers are small and therefore fluctuate from year to year, around 16% of children and adolescents receive pre-emptive kidney transplants. Of the remainder, 45% commence renal replacement therapy with haemodialysis compared with 38% starting with peritoneal dialysis.

Figure 11.4  Modality of Initial Renal Replacement Therapy By Year of First Treatment - Australia and New Zealand < 20 Years of Age at First Treatment										
Command	Year									
Current Treatment	2003	2004	2005	2006	2007	2008	Total			
Haemodialysis	28 (41%)	31 (54%)	23 (43%)	23 (45%)	26 (43%)	35 (45%)	166 (45%)			
Peritoneal Dialysis	29 (43%)	22 (38%)	18 (33%)	18 (35%)	26 (43%)	30 (39%)	143 (39%)			
Transplant	11 (16%)	5 (9%)	13 (24%)	10 (20%)	9 (15%)	12 (16%)	60 (16%)			
Total	68 (100%)	58 (100%)	54 (100%)	51 (100%)	61 (100%)	77 (100%)	355 (100%)			

For prevalent patients (Figure 11.5), a very different pattern is seen, with the great majority of children and adolescents with a functioning transplant. This reflects the relatively high rate of transplantation among children.

### PD TECHNIQUE SURVIVAL BY AGE CATEGORY

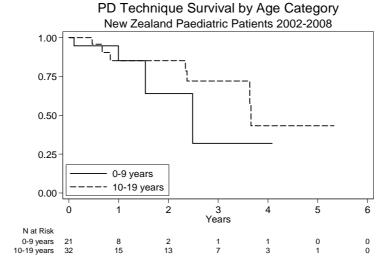

PD technique survival, censored for transplantation, loss to follow-up and recovery of renal function is presented.

The numbers available for analysis after the first year drop significantly in each age group in both countries, probably due to early transplantation. Of the 194 patients, 63 (32%) received a transplant within one year of commencement of RRT. By two years a total of 88 (45%) of patients had received transplants.
